

## BGP

1. LOCAL-PREF  $\rightarrow$  largest
2. AS-PATH  $\rightarrow$  shortest
3. MED  $\rightarrow$  lowest
4. eBGP learned route over iBGP learned one
5. Hot Potato routing
6. Router ID - lowest

- 1) If want all <sup>BGP</sup> routers in AS100 to use the top route (AS200 AS300 AS600) admin of AS100 can set LOCAL-PREF highest for it.
- 2) Suppose we want all <sup>BGP</sup> routers to use the lower route AS400 - AS600
  - (i) Use LOCAL-PREF
  - (ii) By default all will use the shortest AS-PATH (no need to set LOCAL-PREF highest for this path)

Suppose LOCAL-PREF and MED are same for both paths

Path 1: AS 200 - 300 - 600

Path 2: AS 400 - 700 - 600

$R_1$ : learned Path 1 over eBGP; Path 2 over iBGP

$R_2$ : -- Path 2 -- " --; Path 1 -- " --

$R_3$ : both over iBGP

$R_1$  uses Path 1

$R_2$  uses Path 2

If  $\text{dist}(R_3, R_1) < \text{dist}(R_3, R_2)$  then  $R_3$  uses path 1 (Hot Potato)

AS100

BGP interact  
with IGP?

Solutions:

## 1) Encapsulation

Suppose  $R_9, R_{11}, R_{12}$  have no BGP information

Ex in  $R_9$ 's table  
(168)

| DST      | Next     |
|----------|----------|
| $R_1$    | $R_{11}$ |
| $R_2$    | $R_{12}$ |
| $R_3$    | $R_3$    |
| $R_{11}$ | $R_{11}$ |
| $R_{12}$ | $R_{12}$ |

$142.32.6/24 \rightarrow ?$

IP add.  $D = 142.32.6, 21$

$R_1$  receives this pkt, strips off outer IP layer, forwards the "internal pkt" to  $R_4$

$R_1$ 's table

| DST           | Next  |
|---------------|-------|
| $R_2$         |       |
| $R_3$         |       |
| $\vdots$      |       |
| $142.32.6/24$ | $R_4$ |

## 2) Pervasive BGP

All routers are BGP speakers in AS100

\* Suppose there is a unique exit for 142.32.6/24

R<sub>1</sub>:

| BGP table    | Prefix            | Gateway/Exit   | IGP | DST IP addr     | Next                 |
|--------------|-------------------|----------------|-----|-----------------|----------------------|
| true for all | 142.32.6/24<br>D↑ | R <sub>1</sub> |     | R <sub>2</sub>  | R <sub>11</sub><br>⋮ |
|              |                   |                |     | R <sub>3</sub>  |                      |
|              |                   |                |     | R <sub>1</sub>  |                      |
|              |                   |                |     | R <sub>11</sub> |                      |
|              |                   |                |     | R <sub>12</sub> |                      |
|              |                   |                |     |                 |                      |

On receiving [SRC | D | ....] from R<sub>3</sub>

recursive lookup.

forward to R<sub>11</sub>

### 3) Tagged IGP

BGP  $\xrightarrow{\text{insert routes}}$  IGP

Internal Routers may not be BGP speakers  
But IGP allows addition of tags

R<sub>1</sub> can insert into its own IGP  $\rightarrow$  gateway router

142.32.6/24  
prefix

R<sub>1</sub>  
tag

propagated to all routers using IGP (say LSR)

At R<sub>9</sub>

IGMP table

| DST                                       | Next            | Tag               | Cost |
|---|-----------------|-------------------|------|
| R <sub>1</sub>                            | R <sub>11</sub> |                   | 5    |
| R <sub>2</sub>                            | R <sub>12</sub> |                   | 10   |
| ⋮   |                 |                   |      |
| from R <sub>1</sub> ← 142.32.6/24         |                 | (R <sub>1</sub> ) |      |
| announced by R <sub>2</sub> ← 142.32.6/24 |                 | (R <sub>2</sub> ) |      |

R<sub>3</sub> → R<sub>9</sub>: 

|     |   |     |
|-----|---|-----|
| src | D | ... |
|-----|---|-----|

lookup, find matches and forwards to closest "tag"  
→ Hot potato routing
