Lecture 7: Conjunctive Normal Form

Instructor: Ashutosh Gupta

IITB, India

Compile date: 2021-01-15

Normal forms

- ▶ Grammar of propositional logic is too complex.
- ▶ If one builds a tool, one will prefer to handle fewer connectives and simpler structure
- ▶ We transform given formulas into normal forms before handling them.

We will look at the following two normal forms

- ▶ Negation normal form
- ▶ Conjunctive normal forms

Commentary: Building a software for handling formulas with the complexity is undesirable. We aim to reduce the complexity by applying transformations to obtain a normalized form. The normalization results in standardization and interoperability of tool.

Removing \oplus , \Rightarrow , and \Leftrightarrow .

Please note the following equivalences that remove \oplus , \Rightarrow , and \Leftrightarrow from a formula.

- ▶ $(p \Rightarrow q) \equiv (\neg p \vee q)$
- ▶ $(p \oplus q) \equiv (p \vee q) \wedge (\neg p \vee \neg q)$
- ▶ $(p \Leftrightarrow q) \equiv \neg(p \oplus q)$

For the ease of presentation, we will assume you can remove them at will.

Commentary: Removing \Rightarrow is common and desirable. The removal of \oplus and \Leftrightarrow , however, blows up the formula size. Their straight up removal is not desirable. We can avoid the blow up in some contexts. However, in our presentation we will skip the issue.

Topic 7.1

Negation normal form

Negation normal form (NNF)

Definition 7.1

A formula is in NNF if \neg appears only in front of the propositional variables.

Theorem 7.1

For every formula F , there is a formula F' in NNF such that $F \equiv F'$.

Proof.

Due to the standard equivalences, we can always push \neg under the logical connectives. □

Example 7.1

Consider $\neg(q \Rightarrow ((p \vee \neg s) \oplus r))$

$$\equiv q \wedge \neg((p \vee \neg s) \oplus r) \equiv q \wedge (\neg(p \vee \neg s) \oplus r) \equiv q \wedge ((\neg p \wedge \neg \neg s) \oplus r) \equiv q \wedge ((\neg p \wedge s) \oplus r)$$

- There are negations hidden inside \oplus , \Rightarrow , and \Leftrightarrow .

Sometimes users want to also remove the symbols, while producing NNF.

Often we assume that the formulas are in NNF.

hidden

↑

negation

Exercise : NNF

Exercise 7.1

Convert the following formulas into NNF

- ▶ $\neg(p \Rightarrow q)$
- ▶ $\neg(\neg((s \Rightarrow \neg(p \Leftrightarrow q))) \oplus (\neg q \vee r))$

$$\begin{aligned} &\neg((p \Rightarrow q) \Rightarrow (p \Rightarrow q)) \\ &\neg\neg\neg p \end{aligned}$$

Exercise 7.2

In the above exercises, remove \Rightarrow , \Leftrightarrow , and \oplus before turning the above into NNF.

Exercise 7.3

Let us suppose we have access to the parse tree of a formula, which is represented as a directed acyclic graph (DAG) (not as a tree). Write an algorithm that produces negation normal form (NNF) of the formula in linear time in the size of the DAG. You may assume the costs of reading from and writing to a map data structure are constant time.

Apply dfs and if-else on each op

Formal derivation for NNF

Theorem 7.2

Let F' be the NNF of F . If we have $\Sigma \vdash F$, then we can derive $\Sigma \vdash F'$.

Proof.

We combine the following pieces of proofs for each step of the transformation.

- ▶ Derivations for Substitutions.
- ▶ Derivations for pushing negations inside connectives.

Therefore, we have the derivations.

Topic 7.2

Conjunctive normal form

Some terminology

- ▶ Propositional variables are also referred as atoms
- ▶ A literal is either an atom or its negation
- ▶ A clause is a disjunction of literals.

Since \vee is associative, commutative, and absorbs multiple occurrences, a clause may be referred as a set of literals.

Example 7.2

- ▶ p is an atom but $\neg p$ is not.
- ▶ $\neg p$ and p both are literals.
- ▶ $p \vee \neg p \vee p \vee q$ is a clause.
- ▶ $\{p, \neg p, q\}$ is the same clause.

Same clause

Conjunctive normal form(CNF)

Definition 7.2

A formula is in CNF if it is a conjunction of clauses.

Since \wedge is associative, commutative and absorbs multiple occurrences, a CNF formula may be referred as a set of clauses

Example 7.3

- ▶ $\neg p$ and p both are in CNF.
- ▶ $(p \vee \neg q) \wedge (r \vee \neg q) \wedge \neg r$ in CNF.
- ▶ $\{(p \vee \neg q), (r \vee \neg q), \neg r\}$ is the same CNF formula.
- ▶ $\{\{p, \neg q\}, \{r, \neg q\}, \{\neg r\}\}$ is the same CNF formula.

Some { $\{p\}$, $\{\neg p\}$ } }
False, { $\{p\}$, $\{\neg p\}$ } }
True : { $\{p, \neg p\}$ }

Exercise 7.4

- a. Write a formal grammar for CNF
- b. How can we represent true and false using CNF formulas?

CNF conversion

Theorem 7.3

For every formula F there is another formula F' in CNF s.t. $F \equiv F'$.

Proof.

Let us suppose we have

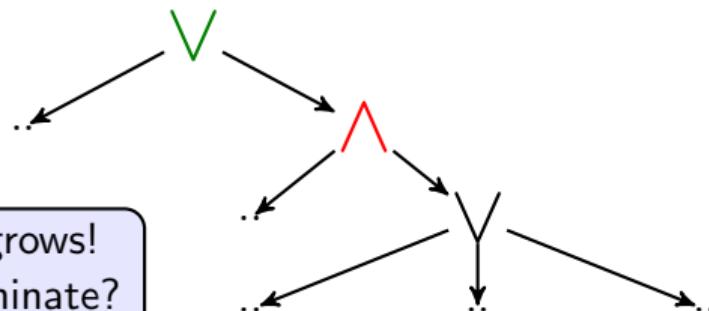

- ▶ removed \oplus , \Rightarrow , \Leftrightarrow using the standard equivalences,
- ▶ converted the formula in NNF with removal of \Rightarrow , \Leftrightarrow , and \oplus , and
- ▶ flattened \wedge and \vee .

Now push all \vee inside and
bring \wedge outside

CNF conversion (contd.)

Proof(contd.)

Now the formulas have the following form with literals at leaves.

After the push formula size grows!
Why should the method terminate?

Since \vee distributes over \wedge , we can always push \vee inside \wedge .

Eventually, we will obtain a formula that is CNF.

Example 7.4

Conversion to CNF

$$(p \Rightarrow (\neg q \wedge r)) \wedge (p \Rightarrow \neg q) \equiv (\neg p \vee (\neg q \wedge r)) \wedge (\neg p \vee \neg q) \equiv (\neg p \vee \neg q) \wedge (\neg p \vee r) \wedge (\neg p \vee \neg q)$$

Are we done?

Commentary: The above is a good example of an algorithm that has intuitively clear but formally non-trivial termination argument.

CNF conversion terminates

Theorem 7.4

The procedure of converting a formula into CNF terminates.

Proof.

For a formula F , let $\nu(F) \triangleq$ the maximum height of \vee to \wedge alternations in F .

Consider a formula $F(G)$ such that

$$G = \bigvee_{i=0}^m \bigwedge_{j=0}^{n_i} G_{ij}.$$

After the push we obtain $F(G')$, where

$$G' = \bigwedge_{j_1=0}^{n_1} \dots \bigwedge_{j_m=0}^{n_m} \bigvee_{i=0}^m \underbrace{G_{ij_i}}_{\nu(\quad) < \nu(G)}$$

Observations

- ▶ G' is either the top formula or the parent connective is \wedge
- ▶ G_{ij} is either a literal or an \vee formula

...

We need to apply flattening to keep $F(G')$ in the form (like the previous proof).

CNF conversion terminates (contd.)

(contd.)

Due to König lemma, the procedure terminates. [König lemma slides are at the end.] (why?) □

Exercise 7.5

Consider a set of balls that are labelled with positive numbers. We can replace a k labelled ball with any number of balls with labels less than k . Using König lemma, show that the process always terminates.

Hint: in the above exercise, the bag is the subformulas of $F(G)$.

Exercise 7.6

Show F' obtained from the procedure may be exponentially larger than F .

Commentary: It is slightly involved to see the application of König lemma on our theorem. We can understand the application via the above exercise. In the above exercise, we are removing balls with large labels and replacing with balls that have smaller labels. This process will eventually hit label 1 for all balls. Once the balls with label 1 are removed, we can not add any more balls. In a similar way in our theorem, we are removing subformulas with larger ν and replacing with many subformulas with smaller ν . Therefore, the process will terminate. The formal constructions are left for the exercise.

Formal derivation for CNF

Theorem 7.5

Let F' be the CNF of F . If we have $\Sigma \vdash F$, then we can derive $\Sigma \vdash F'$.

Proof.

We combine the following pieces of proofs for each step of the transformations.

- ▶ Derivations for NNF
- ▶ Derivations for substitutions that remove \Rightarrow , \oplus , and \Leftrightarrow
- ▶ Derivations for substitutions that flatten \wedge and \vee
- ▶ Derivations for substitutions that apply distributivity

Therefore, we have the derivations. □

Conjunctive normal form(CNF) more notation

- ▶ A **unit clause** contains only one literal.
- ▶ A **binary clause** contains two literals.
- ▶ A **ternary clause** contains three literals.
- ▶ We extend the definition of clauses to the empty set of literals. Say, \perp is the empty clause.

Example 7.5

- ▶ $(p \wedge q \wedge \neg r)$ has three unit clauses
- ▶ $(p \vee \neg q \vee \neg s) \wedge (p \vee q) \wedge \neg r$ has a ternary, a binary, and a unit clause

~~Exercise 7.7~~

- ~~a. Give a linear time algorithm to prove validity of a CNF formula~~
- ~~b. What is the interpretation of empty set of clauses?~~

Topic 7.3

Tseitin's encoding

CNF is desirable

- ▶ Fewer connectives
- ▶ Simple structure
- ▶ Many problems naturally encode into CNF.

We will see this in couple of lectures.

How do we get to CNF?

- ▶ The transformation using distributivity **explodes** the formula
- ▶ Is there a way **to avoid** the explosion?
- ▶ Yes! there is a way.

Tseitin's encoding

But, with a **cost**.

Tseitin's encoding : intuition

Example 7.6

Consider formula $p \vee (q \wedge r)$, which is not in CNF.

We replace offending $(q \wedge r)$ by a fresh x and add clauses to encode that x behaves like $(q \wedge r)$.

$$(p \vee x) \wedge (x \Rightarrow (q \wedge r))$$

After simplification,

$$(p \vee x) \wedge (\neg x \vee q) \wedge (\neg x \vee r)$$

Exercise 7.8

Ideally, we should have introduced $(x \Leftrightarrow (q \wedge r))$. Why is the above with implication correct?

Tseitin's encoding (Plaisted-Greenbaum optimization included)

By introducing fresh variables, Tseitin's encoding can translate every formula into an equisatisfiable CNF formula without exponential explosion.

1. Assume input formula F is NNF without \oplus , \Rightarrow , and \Leftrightarrow .
2. Find a $G_1 \wedge \dots \wedge G_n$ that is just below an \vee in $F(G_1 \wedge \dots \wedge G_n)$
3. Replace $F(G_1 \wedge \dots \wedge G_n)$ by $F(p) \wedge (\neg p \vee G_1) \wedge \dots \wedge (\neg p \vee G_n)$, where p is a fresh variable
4. goto 2

Exercise 7.9

Modify the encoding such that it works without the assumptions at step 1

Apply each time?

Commentary: If you read wikipedia about the encoding, you will find that Tseitin's encoding adds more clauses. The above translation includes Plaisted-Greenbaum optimization. Solve the above exercise to understand the difference. Hint: Download sat solver \$wget <http://fmv.jku.at/limboole/limboole1.1.tar.gz> look for function tseitin in file limboole.c

Example: linear cost of Tseitin's encoding

$$mn \rightarrow m+n+1$$

Example 7.7

Consider formula $(p_1 \wedge \dots \wedge p_n) \vee (q_1 \wedge \dots \wedge q_m)$

Using distributivity, we obtain the following CNF containing mn clauses.

$$\bigwedge_{i \in 1..n, j \in 1..m} (p_i \vee q_j)$$

Using Tseitin's encoding, we obtain the following CNF containing $m + n + 1$ clauses, where x and y are the fresh Boolean variables.

$$(x \vee y) \wedge \bigwedge_{i \in 1..n} (\neg x \vee p_i) \wedge \bigwedge_{j \in 1..m} (\neg y \vee q_j)$$

$$\curvearrowright m(x) = 0, m(y) = 0, m(\text{All others}) = 1$$

~~Exercise 7.10~~

Give a model to the original formula that is not a model of the transformed formula

Tseitin's encoding preserves satisfiability

Let us prove one direction of the equisatisfiability.

Theorem 7.6

if $m \models F(p) \wedge (\neg p \vee G_1) \wedge \cdots \wedge (\neg p \vee G_n)$ then $m \models F(G_1 \wedge \cdots \wedge G_n)$

Proof.

Assume $m \models F(p) \wedge (\neg p \vee G_1) \wedge \cdots \wedge (\neg p \vee G_n)$. We have three cases.

First case $m \models p$:

- ▶ Therefore, $m \models G_i$ for all $i \in 1..n$.
- ▶ Therefore, $m \models G_1 \wedge \cdots \wedge G_n$. *Also, $m \models F(p)$*
- ▶ Due to the substitution theorem, $m \models F(G_1 \wedge \cdots \wedge G_n)$.

Second case $m \not\models p$ and $m \not\models G_1 \wedge \cdots \wedge G_n$:

- ▶ Due to the substitution theorem, $m \models F(G_1 \wedge \cdots \wedge G_n)$

Tseitin's encoding preserves satisfiability(contd.)

Proof(contd.)

Third case $m \not\models p$ and $m \models G_1 \wedge \dots \wedge G_n$:

Substituted

- ▶ Since $F(G_1 \wedge \dots \wedge G_n)$ is in NNF, p occurs only positively in $F(p)$.
- ▶ Therefore, $m[p \mapsto 1] \models F(p)$ (why?). ✓
- ▶ Since p does not occur in G_i s, $m[p \mapsto 1] \models G_1 \wedge \dots \wedge G_n$. ✓
- ▶ Due to the substitution theorem, $m[p \mapsto 1] \models F(G_1 \wedge \dots \wedge G_n)$ ✓
- ▶ Therefore, $m \models F(G_1 \wedge \dots \wedge G_n)$.

□

We leave the other direction of equisatisfiability as the following exercise.

~~Exercise 7.11~~

Show if $\not\models F(p) \wedge (\neg p \vee G_1) \wedge \dots \wedge (\neg p \vee G_n)$ then $\not\models F(G_1 \wedge \dots \wedge G_n)$

Topic 7.4

Disjunctive normal form

Disjunctive normal form(DNF)

Definition 7.3

A formula is in DNF if it is a disjunction of conjunctions of literals.

Theorem 7.7

For every formula F there is another formula F' in DNF s.t. $F \equiv F'$.

Proof.

Proof is similar to CNF.

□

~~Exercise 7.12~~

- a. Give the formal grammar of DNF
- b. Give a linear time algorithm to prove satisfiability of a DNF formula

Check if atleast one conjunction doesn't have $P, \neg P$

Topic 7.5

Problems

Monotonic NNF

Definition 7.4

If $m \models F$, let $\text{pos}(F, m)$ be the set of literals that are true in m and appear in F .

Example 7.8

$$\text{pos}(\neg p_2 \wedge (p_1 \vee p_2), \{p_1 \mapsto 1, p_2 \mapsto 0\}) = \{p_1, \neg p_2\}$$

Exercise 7.13

Show that if $m \models F$ and $\text{pos}(m, F) \subseteq \text{pos}(m', F)$ then $m' \models F$.

CNF and DNF

Exercise 7.14

Give an example of a non-trivial formula that is both CNF and DNF

Exercise 7.15

Convert the following formulas into CNF with/without introducing fresh variables

1. $\neg((p \Rightarrow q) \Rightarrow ((q \Rightarrow r) \Rightarrow (p \Rightarrow r)))$
2. $(p \Rightarrow (\neg q \Rightarrow r)) \wedge (p \Rightarrow \neg q) \Rightarrow (p \Rightarrow r)$
3. $(p \Rightarrow q) \vee (q \Rightarrow \neg r) \vee (r \Rightarrow q) \Rightarrow \neg(\neg(q \Rightarrow p) \Rightarrow (q \Leftrightarrow r))$

P=NP argument

~~Exercise 7.16~~

What is wrong with the following proof of P=NP? Give counterexample.

Tseitin's encoding does not explode and proving validity of CNF formulas has a linear time algorithm. Therefore, we can convert every formula into CNF in polynomial time and check validity in linear time. As a consequence, we can check satisfiability of F in linear time by checking validity of $\neg F$ in linear time.

Validity**

Exercise 7.17

Give a procedure like Tseitin's encoding that converts a formula into another equi-valid DNF formula. Prove correctness of your transformation.

Algebraic normal form(ANF)**

ANF formulas are defined using the following grammar.

$$\begin{aligned} A &::= \top \mid \perp \mid p \\ C &::= A \wedge C \mid A \\ ANF &::= C \oplus ANF \mid C \end{aligned}$$

Exercise 7.18

- Give an efficient algorithm to convert any formula into equivalent ANF formula.*
- Give an efficient algorithm to convert any formula into equisatisfiable ANF formula.*

CNF vs. DNF***

Exercise 7.19

Give a class of Boolean functions that can be represented using linear size DNF formula but can only be represented by an exponential size CNF formula.

Exercise 7.20

Give a class of Boolean functions that can be represented using linear size CNF formula but can only be represented by an exponential size DNF formula.

Probability of satisfiability***

Exercise 7.21

- a. *What is the probability that the conjunction of a random multiset of literals of size k over n Boolean variables is unsatisfiable?*
- b. *What is the probability that the conjunction of a random set of literals of size k over n Boolean variables is unsatisfiable?*

And invertor graphs (AIG)**

AIG formulas are defined using the following grammar.

$$A ::= A \wedge A | \neg A | p$$

Exercise 7.22

Give heuristics to minimize the number of inverters in an AIG formula without increasing the size of the formula.

Commentary: Example of such heuristics: Local Two-Level And-Inverter Graph Minimization without Blowup. Robert Brummayer and Armin Biere, 2006.

Topic 7.6

Supporting slides

König's Lemma

Theorem 7.8

For an infinite connected graph G , if degree of each node is finite then there is an infinite simple path in G from each node.

Proof.

We construct an infinite simple path v_1, v_2, v_3, \dots as follows.

base case:

Choose any $v_1 \in G$. Let $G_1 \triangleq G$.

induction step:

1. Assume path v_1, \dots, v_i and an infinite connected graph G_i such that $v_i \in G_i$ and $v_1 \dots v_{i-1} \notin G_i$.
2. In G_i , there is a neighbour $v_{i+1} \in G_i$ of v_i such that infinite nodes are reachable from v_{i+1} without visiting v_i . (why?)
3. Let S be the reachable nodes. Let $G_{i+1} \triangleq G_i|_S$.

Exercise 7.23

Prove that any finitely-branching infinite tree must have an infinite branch.

End of Lecture 7
